Weekly Change in Mindfulness and Perceived Stress in a Mindfulness-Based Stress Reduction Program

Ruth A. Baer,[1]* James Carmody,[2] and Matthew Hunsinger[3]

[1] *University of Kentucky*
[2] *University of Massachusetts Medical School*
[3] *Mary Baldwin College*

Objective: The purpose of the study was to examine weekly change in self-reported mindfulness and perceived stress in participants who completed an 8-week course in mindfulness-based stress reduction (MBSR). **Method:** Participants were 87 adults with problematic levels of stress related to chronic illness, chronic pain, and other life circumstances (mean age = 49 years, 67% female) participating in MBSR in an academic medical center. They completed weekly self-report assessments of mindfulness skills and perceived stress. It was hypothesized that significant improvement in mindfulness skills would precede significant change in stress. **Results:** Mindfulness skills and perceived stress both changed significantly from pretreatment to posttreatment. Significant increases in mindfulness occurred by the second week of the program, whereas significant improvements in perceived stress did not occur until week 4. Extent of change in mindfulness skills during the first three weeks predicted change in perceived stress over the course of the intervention. **Conclusions:** Evidence that changes in mindfulness precede changes in perceived stress in a standard MBSR course is consistent with previous studies suggesting that improvements in mindfulness skills may mediate the effects of mindfulness training on mental health outcomes. © 2012 Wiley Periodicals, Inc. J. Clin. Psychol. 68:755–765, 2012.

Keywords: mindfulness; stress; mindfulness-based stress reduction; weekly change

The benefits of mindfulness training for a variety of problems, disorders, and populations are increasingly recognized. Mindfulness-based stress reduction (MBSR; Kabat-Zinn, 1982, 1990) is among the most commonly cited of the empirically supported mindfulness-based interventions. It was developed in a behavioral medicine setting for heterogeneous groups suffering from a variety of pain and stress-related complaints and has been adapted for a wide range of populations. In its standard form, it includes eight weekly sessions of 2.5 hours, with an all-day session during Week 6, for groups of up to 30 participants. Sessions include intensive practice of three primary mindfulness-based meditation exercises: the body scan, sitting meditation, and gentle yoga, all of which encourage nonjudgmental observation and acceptance of bodily sensations, cognitions, emotional states, urges, and environmental stimuli as they arise. Participants are encouraged to practice these exercises for up to 45 minutes per day, 6 days per week, using

*SOCIAL responsibility of business
*SOCIAL media

Abstract:

While the circulation of **disinformation** and **misinformation online** can pose a variety of risks to societies around the world, it should also be of concern that overreacting to such false information can undermine human rights, including freedom of expression. The business operations of global **social media** platforms frequently intersect with this latter concern because of a spike in the adoption of national laws that ban "**fake news**" as well as their own platform policies to tackle false information. This Essay assesses the corporate responsibility standards afforded by the United Nations' Guiding Principles on Business & Human Rights as well as the International Covenant on Civil and Political Rights and explains several key ways in which the guidance that these instruments provide is relevant to **social media** companies in tackling false information on their platforms. SAGE

Digital Disinformation and the Imaginative Dimension of Communication

Jason Vincent A. Cabañes[1]

Abstract

To nuance current understandings of the proliferation of digital disinformation, this article seeks to develop an approach that emphasizes the imaginative dimension of this communication phenomenon. Anchored on ideas about the sociality of communication, this piece conceptualizes how fake news and political trolling online work in relation to particular shared understandings people have of their socio-political landscape. It offers the possibility of expanding the information-oriented approach to communication taken by many journalistic interventions against digital disinformation. It particularly opens up alternatives to the problematic strategy of challenging social media manipulation solely by doubling down on objectivity and facts.

Keywords

digital disinformation, fake news, political trolling, social narratives, audiences

The slew of recent works on digital disinformation has spotlighted the unprecedented proliferation of organized information disorder campaigns across the globe. Many of these works—including those from journalists and academics alike—have focused on revealing the startling arsenal of social media manipulation strategies that have been developed in different countries the world over (Bradshaw & Howard, 2017). They have cataloged, among others, Cambridge Analytica's psychographic targeting experiments on Facebook (Cadwalladr & Graham-Harrison, 2018; Ireton & Posetti,

H7N9 influenza A virus activation of necroptosis in human monocytes links innate and adaptive immune responses

Abstract

We previously demonstrated that avian influenza A H7N9 virus preferentially infected CD14+ monocyte in human peripheral blood mononuclear cells (PBMCs), which led to apoptosis. To better understand H7N9 pathogenesis in relation to monocyte cell death, we showed here that extensive phosphorylation of mixed lineage kinase domain-like (MLKL) protein occurred concurrently with the activation of caspases-8, -9 and -3 in H7N9-infected monocytes at 6 h post infection (hpi), indicating that apoptosis and necroptosis pathways were simultaneously activated. The apoptotic morphology was readily observed in H7N9-infected monocytes with transmission electron microscopy (TEM), while the pan-caspase inhibitor, IDN6556 (IDN), accelerated cell death through necroptosis as evidenced by the increased level of pMLKL accompanied with cell swelling and plasma membrane rupture. Most importantly, H7N9-induced cell death could only be stopped by the combined treatment of IDN and necrosulfonamide (NSA), a pMLKL membrane translocation inhibitor, but not by individual inhibition of caspase or RIPK3. Our data further showed that activation of apoptosis and necroptosis pathways in monocytes differentially contributed to the immune response of monocytes upon H7N9 infection. Specifically, caspase inhibition significantly enhanced, while RIPK3 inhibition reduced the early expression of type I interferons and cytokine/chemokines in H7N9-infected monocytes. Moreover, culture supernatants from IDN-treated H7N9-infected monocyte promoted the expression of co-stimulatory molecule CD80, CD83 and CD86 on freshly isolated monocytes and monocyte-derived dendritic cells (MDCs) and enhanced the capacity of MDCs to induce $CD3^+$ T-cell proliferation in vitro. In contrast, these immune stimulatory effects were abrogated by using culture supernatants from H7N9-infected monocyte with RIPK3 inhibition. In conclusion, our findings indicated that H7N9 infection activated both apoptosis and necroptosis in monocytes. An intact RIPK3 activity is required for upregulation of innate immune responses, while caspase activation suppresses the immune response.

Introduction

Influenza A virus infection and replication in host cells induce apoptosis[1], necroptosis[2] and pyroptosis[3]. Viral protein including PB1-F2[4], NP[5] and NS1[6] trigger apoptosis through the intrinsic pathway by mitochondrial dependent activation of caspase-9[1,7]. At the same time, virus-induced cytokines, for instance Fas/FasL[8] and tumour necrosis factor-related apoptosis-inducing ligand (TRAIL)[9] activate extrinsic apoptosis through death receptor/ligand mediated caspase-8 activation. Influenza virus infection also leads to necroptosis, a form of regulated necrosis. Necroptosis depends on the formation and activation of necrosome, which consists of receptor-interacting protein kinase-1 (RIPK1), -3 (RIPK3), and mixed lineage kinase domain-like (MLKL)[10]. Activation of RIPK1/RIPK3 leads to the phosphorylation of MLKL,
